Exp No: 15	**Report and presentation on career pathways and the future of low-code development.**

AIM:

To prepare a report and a presentation on the career pathways available in low-code development and on the future trends of the low-code platforms, on the basis of the experiments done using Zoho Creator.

ALGORITHM / PROCEDURE:

Low-code development means building the applications mainly with the visual builders and only a small amount of code. After doing the experiments from the forms and the workflows to the integration, security, deployment and the pro-code extension, it is seen that the low-code developer works with both the business side and the technical side. The report is prepared in the following steps.

1. Revise the experiments done in Zoho Creator and list the skills used in them (forms, reports, Deluge, integration, RBAC, deployment, Catalyst).
2. Collect the information from the official documentation of Zoho and from the career and the training sites about the job roles that use low-code platforms.
3. Prepare the list of the career pathways with the skills needed and the type of work done in each role (Table 1).
4. Study the future trends - the AI-assisted app building (like Zia), the growth of the citizen developers, the hybrid use of low-code with the pro-code, and the importance of the governance and the security.
5. Write the report in the simple form with the introduction, the career pathways, the future trends, the challenges and the conclusion.
6. Prepare the presentation of about 8 slides using the plan given in Table 2, with the short points and one diagram on each important slide.
7. Present it to the faculty / class, answer the questions and note down the feedback.
8. Write the personal plan - the skills to be learnt and the certification or the project to be done next.

Table 1 - Career pathways in low-code development

Career pathway	Main skills	Work done
Low-code / Zoho Creator developer	Forms, reports, workflows, Deluge	Builds business apps quickly for the clients or the company
Citizen developer	Business knowledge, basic app builders	Makes small apps for his own department without a big IT team
Integration specialist	APIs, connections, JSON, webhooks	Connects the apps with CRM, accounting and other systems
Business / solution analyst	Requirement study, process mapping	Converts the business needs into the app design
Solution architect	Architecture, security, governance	Plans large solutions mixing low-code and custom code
Full stack / pro-code developer	Node.js, Java, Python, cloud functions	Extends the low-code apps with the real code and services
Automation and AI specialist	Workflow automation, AI tools, data	Adds the AI and the automation to the business processes

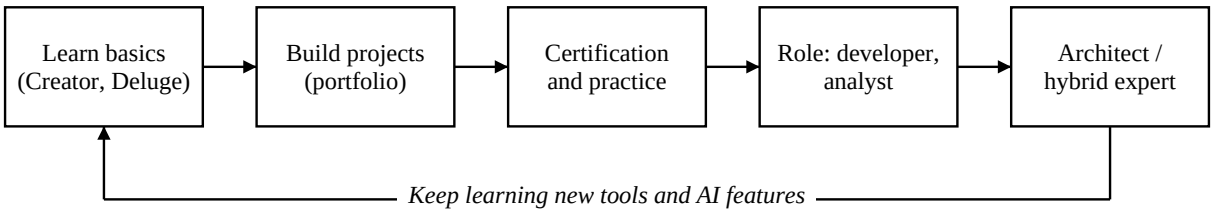
Table 2 - Plan of the presentation

Slide	Content
1	Title slide - topic, name and register number
2	What is low-code development (short definition and examples)
3	Why the low-code platforms are growing
4	Career pathways (from Table 1)
5	Skills to learn - Deluge, APIs, databases, a pro-code language
6	Future trends - AI-assisted building, hybrid apps, governance
7	Challenges and how to prepare for them
8	Conclusion and references

Note: the job roles and the trends change quickly, so the latest information should be taken from the current sources before the final presentation. The future trends given here are general observations and not exact predictions.

DIAGRAM:

Fig 1: A possible career path in low-code development



RESULT:

Thus the report and the presentation on the career pathways and the future of low-code development were prepared. The roles such as the low-code developer, the integration specialist and the solution architect were identified, and it was understood that the future belongs to the AI-assisted and hybrid development in which the low-code platforms and the pro-code skills work together.
